

Atwe — Everything That Needs You

The complete list. Nothing on it can be done by writing code.

Atwe is built. 497 of its 505 features are live and verified. This document is the whole of what remains on your side — keys to paste, decisions only an owner can make, words only a human can write, accounts only you can open, and the handful of features genuinely blocked on the outside world.

Work through it at your own pace. Nothing here stops me building in the meantime.

Build 1648 · 22 connections · 18 decisions · 5 pieces of writing · 9 accounts · 7 launch checks · 7 blocked features
The live version of Part 1 is in your admin dashboard → **Setup**

What's in here

Part 1 · Keys to paste — 22 connections, sorted by urgency	3
Part 2 · Decisions only you can make — pricing, limits, what Atwe earns	7
Part 3 · Words only you can write — legal, help, announcements	10
Part 4 · Accounts & hosting — domains, backups, Apple, Google	11
Part 5 · Before you open the doors — the launch check	12
Part 6 · The ongoing job — queues that need a human, forever	13
Part 7 · The 7 unfinished features	14

How to read this

A red **"Decide"** or **"Do first"** tag means it is either costing you money right now, or it would hurt if it were still like this when real members arrive. Everything else can wait.

Where the keys go — the same five steps every time

- 1 Open **railway.app** and sign in.
- 2 Click your Atwe project, then the service running the app.
- 3 Open the **Variables** tab.
- 4 Press **New Variable**. The name is the `CAPITAL_LETTER` one in this document; the value is what the provider gave you. No quotes, no spaces.
- 5 Railway redeploys itself. Wait a minute, then check admin → **Setup**. The light should be green.

Not green? Nine times out of ten the name is misspelled or a space crept onto the end of the value. Nothing is broken — the feature just stays off until it matches.

Safety: these keys are passwords. Keep them in Railway. Never in a message, an email or a screenshot.

The database is not on this list — Railway wires that up on its own.

Part 1 · Keys to paste

Do first — before real members

Until these are done, Atwe is a very convincing demo rather than a real product.

☐ Sign-in secret

DO FIRST

Turns on Signs everybody's login so it can't be forged.

Without it An insecure development value is used and every session breaks on restart. Must be set before real members.

Where Invent one long random string and paste it into Railway → Variables.

Paste as JWT_SECRET

☐ Site address

DO FIRST

Turns on Correct links in emails, share links, QR codes and the product feed.

Without it Links in emails point nowhere useful.

Where Set it to https://atwe.com in Railway → Variables.

Paste as APP_URL

☐ Card payments (Stripe)

DO FIRST

Turns on Real card payments: topping up a wallet, Atwe Pro, event tickets, paid subscriptions, boosts.

Without it Every payment is a DEMO grant — the money is pretend. Fine for testing, never for real members.

Where stripe.com → Developers → API keys. Then add a webhook to /api/billing/webhook and paste its signing secret. Turn Connect on in the same dashboard for cash-out to bank.

Paste as STRIPE_SECRET_KEY STRIPE_WEBHOOK_SECRET STRIPE_PRICE_ID

☐ Sales tax

DO FIRST

Turns on Tax added at checkout and recorded on the order.

Without it Every order charges zero tax. Legal exposure once you sell for real.

Where Simplest: SALES_TAX_RATES as a small JSON of region → rate. Or plug in a tax API.

Paste as SALES_TAX_RATES SALES_TAX_RATE TAX_API_URL TAX_API_KEY

☐ Email

DO FIRST

Turns on Verification links, password resets, order confirmations, shipping updates, sign-in alerts, your broadcasts.

Without it Every one of those is written to the server log instead of sent. Nobody can reset a password.

Where Any SMTP provider (Resend, Postmark, SendGrid, Gmail app password).

Paste as SMTP_HOST SMTP_PORT SMTP_USER SMTP_PASS MAIL_FROM

Do soon — big capability, still just a key

Nothing breaks today. Each one switches a large part of Atwe from off to on.

☐ Cash out to a bank (Stripe Connect)

DO SOON

Turns on Members move their Atwe balance to a real bank account.

Without it Cash-out is a demo: the balance drops but no money leaves.

Where Same Stripe account — enable Connect (Express accounts).

Paste as `STRIPE_SECRET_KEY`

☐ Atwe AI

DO SOON

Turns on Everything AI: the assistant, writing help, job matching, resumes, moderation, summaries, the shopping concierge, agent actions.

Without it Roughly 25 features say "not set up on this server". The single biggest switch on this page.

Where console.anthropic.com → API keys.

Paste as `ANTHROPIC_API_KEY`

☐ Push notifications

DO SOON

Turns on Alerts on a phone when the app is closed — messages, orders, money.

Without it Notifications only appear while a tab is open. The come-back-to-Atwe nudge never sends.

Where Generate a VAPID key pair (npx web-push generate-vapid-keys).

Paste as `VAPID_PUBLIC_KEY` `VAPID_PRIVATE_KEY` `VAPID_SUBJECT`

☐ Photo & video storage

DO SOON

Turns on Photos and video live in proper storage: big uploads, long video, fast loading worldwide.

Without it Media is stored inside the database as text. It works, but it is capped small (~16MB) and gets slow as it grows. Worth doing before you have many members.

Where Cloudflare R2 or Backblaze B2 (both cheap, S3-compatible). Point `CDN_URL` at the public bucket.

Paste as `S3_BUCKET` `S3_ACCESS_KEY` `S3_SECRET_KEY` `S3_ENDPOINT` `S3_REGION` `CDN_URL`

☐ Calls that connect anywhere

DO SOON

Turns on Voice and video calls that work on mobile networks and behind office firewalls.

Without it Calls fall back to a free public relay — they often fail to connect on 4G/5G. The most common "calls don't work" cause.

Where Cloudflare dashboard → Calls → TURN. Free tier is generous.

Paste as `CLOUDFLARE_TURN_KEY_ID` `CLOUDFLARE_TURN_API_TOKEN`

When you need it

Genuinely optional. Atwe works properly without every one of these.

☐ Currency conversion

WHEN YOU NEED IT

Turns on The currency picker offers more than dollars (display only — charges stay USD).

Without it **Members only ever see US dollars.**

Where FX_RATES as JSON, e.g. {"EUR":0.92,"GBP":0.79}. Refresh it when you like.

Paste as `FX_RATES`

☐ Making pictures

WHEN YOU NEED IT

Turns on Generate a picture from words, and "tidy up" a product photo.

Without it **Both say they are not set up. (The consent step for photos with people in them lives here too.)**

Where Any image API that takes a prompt — the code is provider-agnostic.

Paste as `IMAGE_API_URL` `IMAGE_API_KEY`

☐ Voice-note transcripts

WHEN YOU NEED IT

Turns on Voice notes get a written transcript under them, for both people.

Without it **Voice notes still send and play — just no text.**

Where Any Whisper-compatible speech-to-text endpoint.

Paste as `STT_API_URL` `STT_API_KEY`

☐ Text messages

WHEN YOU NEED IT

Turns on Text alerts for the two things that matter: a new sign-in, and money received.

Without it **Nothing is texted (it is logged instead).**

Where twilio.com → a number + the account SID and auth token.

Paste as `TWILIO_ACCOUNT_SID` `TWILIO_AUTH_TOKEN` `TWILIO_FROM`

☐ GIF search

WHEN YOU NEED IT

Turns on Searching GIFs in chat and the composer.

Without it **The GIF tab says it is not set up. Stickers and emoji still work.**

Where Google Tenor API key (free) or a Giphy key.

Paste as `TENOR_API_KEY` `GIPHY_API_KEY`

☐ Shipping labels

WHEN YOU NEED IT

- Turns on** Sellers buy a real postage label in the app, and delivery is detected automatically.
- Without it** Sellers type the carrier and tracking number by hand. Everything else about shipping still works.
- Where** goshippo.com → API key. Add a track_updated webhook to /api/webhooks/shippo with a secret you choose.
- Paste as** SHIPPO_API_KEY SHIPPO_WEBHOOK_SECRET

☐ Live carrier prices

WHEN YOU NEED IT

- Turns on** Buyers pick from real shipping options at checkout.
- Without it** Checkout uses the seller's own flat fee. Perfectly workable.
- Where** SHIPPING_RATES as a small JSON list of options, or a carrier API.
- Paste as** SHIPPING_RATES SHIPPING_API_URL SHIPPING_API_KEY

☐ Sign in with Google

WHEN YOU NEED IT

- Turns on** One-tap Google sign-up and sign-in.
- Without it** The Google button is hidden. Email + password still works.
- Where** Google Cloud Console → OAuth client ID (Web).
- Paste as** GOOGLE_CLIENT_ID

☐ Sign in with Apple

WHEN YOU NEED IT

- Turns on** Apple sign-in — and Apple REQUIRES it in the App Store if you offer Google.
- Without it** The Apple button is hidden. Blocks App Store review later.
- Where** Apple Developer → Certificates, Identifiers & Profiles → Services ID.
- Paste as** APPLE_CLIENT_ID APPLE_APP_ID APPLE_DOMAIN_ASSOCIATION

☐ Live share prices

WHEN YOU NEED IT

- Turns on** Prices and charts on \$TICKER pages.
- Without it** Already on by default using a free source — a key only makes it sturdier.
- Where** finnhub.io if the free source ever gets rate-limited.
- Paste as** FINANCE_PROVIDER FINNHUB_API_KEY

☐ Encrypted vault key

WHEN YOU NEED IT

- Turns on** The admin vault encrypts what you store in it.
- Without it** The vault refuses to store secrets.
- Where** Any long random string in Railway → Variables.
- Paste as** DRIVE_KEY

☐ Force staff 2FA

WHEN YOU NEED IT

Turns on Nobody reaches the dashboard without two-factor. Recommended once you have staff.

Without it Staff can sign in with a password alone.

Where Set REQUIRE_ADMIN_2FA=true — but turn 2FA on for your own account FIRST.

Paste as REQUIRE_ADMIN_2FA

Part 2 · Decisions only you can make

Every one of these already has a sensible default, so nothing is broken. But defaults are my guess, not your business. **The first one is switched off and is costing you money on every sale.**

☐ What Atwe earns on each sale

DECIDE

Right now **Nothing — 0%**

Why it matters The platform fee is off. Every marketplace sale passes through with Atwe taking none of it. This is your main revenue line and it is currently switched off.

Change it Admin → Money → the platform fee panel. Up to 20%, with an optional minimum order size and an exemption for verified sellers. Taken from the seller's proceeds — never added on top of the price a buyer was shown.

☐ Promoted post price

OPTIONAL

Right now **\$2 a day**

Why it matters What a member pays to push one of their posts into other people's feeds.

Change it Railway variable, or leave it.

☐ Sponsored ad price

OPTIONAL

Right now **\$5 a day**

Why it matters What a business pays for a proper "Featured Ad" in the feed.

Change it `AD_DAY_CENTS`

☐ Job boost price

OPTIONAL

Right now **\$10**

Why it matters What an employer pays to pin a job to the top for 30 days.

Change it `JOB_BOOST_CENTS`

☐ Featured business placement

OPTIONAL

Right now **\$3 a day**

Why it matters Top of the business directory, always labelled as paid.

Change it `DIRECTORY_FEATURE_DAY_CENTS`

☐ **Affiliate commission**

OPTIONAL

Right now 10% of the sale

Why it matters What someone earns for referring a sale — comes out of the seller's proceeds, not yours.

Change it AFFILIATE_RATE_PCT

☐ **Invite bonus**

DECIDE

Right now \$5 to each side

Why it matters Paid by Atwe out of your own pocket on every successful invite. Watch this one if you grow fast.

Change it Ask me to change it — it is fixed in code.

☐ **Loyalty points**

OPTIONAL

Right now 1% back

Why it matters 100 points = \$1. Also paid by Atwe.

Change it Ask me to change it.

☐ **How much can leave a wallet**

OPTIONAL

Right now \$5,000 a day · \$15,000 a week

Why it matters The anti-fraud ceiling on money moving OUT of any one wallet.

Change it WALLET_DAILY_CAP_CENTS WALLET_WEEKLY_CAP_CENTS

☐ **Cash-out that needs your approval**

OPTIONAL

Right now Over \$1,000

Why it matters Above this, a withdrawal waits in a queue for a human instead of going straight out.

Change it CASHOUT_REVIEW_CENTS

☐ **Free job posts per business**

OPTIONAL

Right now 3

Why it matters The 4th post asks them to upgrade to Pro. Your main reason for a business to pay.

Change it Ask me to change it.

☐ **Creator revenue share**

DECIDE

Right now

Switched OFF

Why it matters

Sharing ad revenue with creators. Off until you decide the split is affordable.

Change it

Admin → Creator share. Default would be 50% of the ad pool.

☐ **Cash advances to sellers**

DECIDE

Right now

Switched OFF

Why it matters

Lending sellers money against future sales. Built and tested, deliberately off — this is lending, with everything that implies.

Change it

Admin → Advances. Do not switch this on without advice.

☐ **Item authentication**

DECIDE

Right now

Switched OFF

Why it matters

Checking an item before it reaches the buyer. Needs someone to actually do the checking.

Change it

Admin → Item authentication. Default fee \$25 on orders over \$200.

☐ **Must members verify their email?**

OPTIONAL

Right now

No

Why it matters

People can use Atwe before confirming their address. Turning it on cuts spam signups but adds friction — and only works once email is connected.

Change it

REQUIRE_EMAIL_VERIFICATION=true

☐ **New-account link restriction**

OPTIONAL

Right now

First 48 hours

Why it matters

A brand-new account can't post links. Spam control.

Change it

PROBATION_HOURS

☐ **Banned words**

OPTIONAL

Right now

Empty

Why it matters

Nothing is filtered anywhere on the platform until you add words.

Change it

Admin → Safety tools → the blocklist.

☐ Country restrictions

OPTIONAL

Right now

None

Why it matters

Atwe is open to every country.

Change it

Admin → Countries, if you ever need to block one.

Part 3 · Words only you can write

The machinery is built for all of these. What's missing is the writing.

☐ **Terms of Service + Privacy Policy — the legal bits**

WRITTEN, BUT INCOMPLETE

Both pages exist and are properly written. What they do NOT contain is your company's legal name, where it is registered, which country's law governs a dispute, or a contact address. A lawyer should fill those in — I can write around them, not decide them.

☐ **Help centre articles**

EMPTY

The whole system is built — write an article in the dashboard and members can read it. Nobody has written one yet. Every article you write is a support ticket you never receive.

☐ **Community guidelines**

WRITTEN

Already there. Worth re-reading so it matches how you actually intend to moderate.

☐ **The @atwe official account**

NOT CREATED

Atwe can post announcements as itself. The account has to exist first — one click in the dashboard.

☐ **Welcome / announcement banners**

EMPTY

The banner across the top of the app, and the "what's new" list. Both empty until you write something.

Part 4 · Accounts & hosting

☐ Domain names

IMPORTANT

atwe.com and admin.atwe.com must both point at the same Railway service, and both be added there as custom domains. The old atwe.ai redirects automatically once its DNS points the same way.

☐ Database backups

IMPORTANT

Railway owns these, not Atwe. Check in your Railway dashboard that backups are on and that you know how to restore one. This is the one thing on this whole list that nobody can fix after the fact.

☐ Stripe webhook

A webhook pointing at /api/billing/webhook — and it must be subscribed to Connect (connected-account) events too, or bank payouts never report back as ready.

☐ Shippo webhook

Only if you use shipping labels: a track_updated webhook so deliveries mark themselves.

☐ Apple Developer account

IMPORTANT

\$99/year. Needed for the App Store, Sign in with Apple, and Apple Pay. Apple takes time to approve — start it early even though the phone app comes later.

☐ Google Play account

\$25, one time. Needed for Android.

☐ Expo account

Free. It is what builds the phone app and sends it to TestFlight without you needing a Mac. You may already have this.

☐ Your admin email

ADMIN_EMAIL decides which account gets made an owner automatically. Set it to your own address.

☐ Support mailboxes

support@ and team@atwe.com are used as the from/reply-to on member email. Make sure mail sent there actually reaches you.

Part 5 · Before you open the doors

Half an hour, once, on the day you decide to let real people in.

- ☐ Turn **demo mode OFF** (it may be on — it fills the app with ~100 fake accounts).
- ☐ Turn the **site lock OFF**, or add the real people to the allowlist we built.
- ☐ Turn on **two-factor for your own admin account** — before forcing it on staff.
- ☐ Make **one real payment** end to end with a live card: top up, buy something, cash out. Watch it land in your Stripe dashboard.
- ☐ Reserve the usernames you don't want taken (@admin, @support, your brand names) — the dashboard can lock thousands at once.
- ☐ Send yourself a **password reset** and confirm the email arrives.
- ☐ Open the app on a phone, install it to the home screen, and check a notification arrives.

Part 6 · The ongoing job

These are not setup — they are the work of running Atwe. Each is a queue where a human has to decide something, and each is already built and waiting in your dashboard. You can hand any of them to staff with only that permission, so nobody sees more than their job needs.

QUEUE	WHAT LANDS IN IT
Reports	Members flagging content or people.
Disputes	A buyer and seller disagreeing over an order. Money is held until you decide.
Refunds	Every refund is staff-reviewed before money moves.
Cash-outs	Withdrawals over your threshold.
Appeals	Someone contesting a suspension.
Business verification	Approving the verified-business seal.
Ads review	Sponsored ads wait for approval before they run.
Affiliation badges	Org logos wait for approval.
Copyright claims	Legal deadlines attached.
Impersonation reports	Someone claiming an account is pretending to be them.
Data requests	GDPR/CCPA — a 30-day legal clock.
Chargebacks	Card disputes, with a bank deadline.
Circle requests	New industry circles.

Support inbox	Member messages.
---------------	------------------

Your dashboard's **Overview** shows how many items are waiting across all of them, so you never have to remember to look in fourteen places.

Part 7 · The 7 unfinished features

Of 505 features, **497 are built and verified**. These are what's left — and only three are waiting on me.

FEATURE	WHAT'S LEFT	WHAT IT NEEDS FROM YOU
Beam on the phone	Groups, photos, voice notes, reactions and calls in the phone app.	Nothing — I can build this now.
Buying on the phone	Full checkout: address, wallet, buyer protection.	Nothing — I can build this now.
Selling on the phone	Shop, orders and numbers from the phone.	Nothing — I can build this now.
App Store listing	Apple Pay and the public listing.	An approved Apple Developer account. Apple also REQUIRES Sign in with Apple if you offer Google.
Android release	Nothing in the code — it already builds.	A Google Play developer account.
Home-screen widgets	Wallet, orders and unread on the phone home screen.	Genuinely blocked: a widget is separate Swift code needing a different build setup. Real work, not a key.
Atwe Card	Actually issuing cards. Waiting list and design already live.	A card-issuing partner plus identity checks. Months, and a legal conversation.

If you only do six things

- 1 Set what Atwe earns per sale.** It is 0% today. Every sale that happens before you change it earns you nothing.
- 2 Stripe.** Turns the money real. Until then every payment is pretend.
- 3 Email.** Without it, anyone who forgets their password is stuck forever.
- 4 The sign-in secret.** One random string, thirty seconds.
- 5 Check your database backups in Railway.** The only item here that cannot be fixed after the fact.
- 6 Start the Apple Developer account.** Apple is slow. Begin it now even though the phone app comes later.

What happens next

- You send me the **5 features** you want added. Rough wording is fine — I'll ask rather than guess.
- I build them, tested against a real database and a real browser.
- We go through the app **page by page, together** — you look, I fix.

4. When you're happy with every page, the web app is done — and only then do we start the phone app.

Atwe — Everything That Needs You · Build 1648.

Part 1 has a live version in your admin dashboard under **Setup**, showing what is actually connected on your server right now.
