

Atwe

Where you and your business live.

Everything you need. One app.

One account for your work, your money and the people you deal with.
This is the complete description of Atwe for the agency, for partners, and
for anyone who needs to understand the whole product. It is written from
what is built and live today, not from a plan, and every claim in it was
checked against the product before it was written down.

Atwe Inc · atwe.com · September 2026

Contents. 1 Atwe in one paragraph · 2 Where Atwe is today · 3 The slogan · 4 The idea · 5 Who Atwe is for · 6 What to say, and what never to say · 7 What Atwe is instead of · 8 The five worlds · 9 How Atwe behaves, and how it speaks · 10 Everything Atwe does · 11 Names, words and facts · 12 Appendix: the complete map of the product.

1. Atwe in one paragraph

A customer messages you. You send a quote from inside the conversation. They accept it, it becomes an invoice with a pay button, and they pay it by card from that button. When someone buys from your shop with protection, the money is held until they confirm it arrived, and the review afterwards moves your reputation. Nothing had to leave Atwe, and nothing had to be typed twice.

That is Atwe: one app for the whole of a working life. You run a business, work for yourself, create, or work for someone else, and you also have friends, family and a feed. Atwe keeps all of it under one name. In one account a person has a profile and a feed, private and group messaging with calls, a shop, a wallet with a real balance, quotes and invoices, a jobs board, a calendar, a business dashboard, and an assistant, Atwe AI, that knows the whole product and can act on their behalf once they confirm. Because all of it is one account, one thing leads to the next.

The approved descriptions. These four are the only wording to use when Atwe has to be described at a fixed length. Cut nothing else down; pick the one that fits.

- **The lockup (three lines, one under the next):** Atwe. / Where you and your business live. / Everything you need. One app. The slashes are only how it is written in this sentence; set it stacked, never run on. Section 3 is the rule book.
- **The line (seven words), for running text and anywhere a stack will not fit:** Atwe. Where you and your business live.
- **A sentence (for a social bio or a store subtitle):** Atwe is one account for a person and a business alike: your feed, your messages and calls, your shop, your wallet, your jobs and your reputation, connected.
- **A short paragraph (for an app store or a partner deck):** Atwe is one app for the whole of a working life. Message and call the people you deal with, sell from your own shop, get paid into a real wallet, hire and be hired, and be seen, all under one name. A customer is also a contact, a follower, a payer and a reviewer, so a quote sent in a conversation becomes the invoice, the payment and the review without anyone typing anything twice. Atwe AI knows the whole product, can look things up in your own account, and acts only after you confirm.
- **The full paragraph (for a press boilerplate):** the two paragraphs at the top of this section, used together and unchanged.

2. Where Atwe is today

Four facts a partner needs before anything else, because they change how everything after them reads.

- **The web app is live at atwe.com and real people use it.** That is wanted, not tolerated. It is not the public release, and it is not promoted yet.
- **The iPhone app has been through TestFlight, and the current 26.8 Beta build is waiting on build credits before it can go out again; Android builds from the same code and waits on a Play developer account.** Both say 26.8 Beta. The version number leads with the year, the way a phone's does.
- **The beginning of 2027 is the official public release of the product:** web, iPhone, Android and desktop, all done and available to everyone. The apps say 27.0 and the word Beta is gone.
- **1 January 2028 is the day Atwe Inc officially begins, with the marketing campaign.** The apps say 28.0.

The two dates are two different things and must never be merged. The product goes public at the start of 2027 and is lived in for a year. The company starts on 1 January 2028, with a product that real members have already used, which is the opposite of launching cold. The full table, and how to talk about the timeline in public, are in Section 11.

3. The slogan

The official Atwe lockup, locked by the founder and not to be altered, is three lines, one under the next:

Atwe.

Where you and your business live.

Everything you need. One app.

The first two lines are the slogan. The third is its sub-line: it is locked to the slogan and travels with it wherever there is room to stack, and it is never folded into the line itself. Where a stack will not fit, the slogan stands alone as one sentence pair, **Atwe. Where you and your business live.**, and that is the form for running text, a spoken read and any single-line space.

The slogan is the founder's own idea with nothing added and nothing to trim. "You and your business" names the two lives one Atwe account holds. "Live" says it is a home, not a tool you visit. The name in front makes it a slogan rather than a strap: read alone on a poster, a bus side or an app store page, it still says who is speaking. It is literally true today, on the web app people already use, and it will still be true after the 2027 release and the 2028 launch. It does not say "online", because a home does not

need to explain where it is, and a word like that dates a line within a few years. The "one place" half of the idea is carried by the word "where": there is one place, and this is it.

Where it came from. The founder's direction, verbatim: "ATWE. A ALL IN ONE PLATFORM. WHERE YOU AND YOUR BUSINESS LIVES ONLINE. (It's like your second home...)". Three ideas live in that sentence: one place, you and your business living online, and a second home. The slogan keeps all three. "All in one platform" is what every large app says about itself and cannot be owned, so it never appears as the line itself; the third line of the lockup is where that idea is kept, in Atwe's own words. "A second home" is the feeling behind the line: the place you keep coming back to, where your things and your people already are. It is the campaign's emotional territory, and a campaign idea can be built on it, but it is not the slogan.

How to set the slogan.

- Always exactly: Atwe. Where you and your business live.
- Two sentences, two full stops. The full stop after Atwe is part of the line; never replace it with a colon, a dash or a line break alone.
- Capitalise Atwe and the first letter of Where. Every other word is lower case. Never set it in all capitals except where a typeface system demands it for every heading on the page.
- The short form, for a space where the name is already visible right beside it (an app store subtitle, a social bio, the cover of this document): Where you and your business live. If the name is not on the page, use the full line.
- Never add an exclamation mark, a question mark, a trademark symbol or an emoji.
- Never append "online", "in one place" or any other qualifier to the line. If the idea needs more words, put them in a sub-line beneath it, not inside it. The one approved sub-line is the third line of the lockup, and it goes beneath, never inside.
- Never translate it loosely. In another language, keep the shape: the name, a full stop, then "where you and your business live".

How to set the third line.

- Always exactly: Everything you need. One app. Two sentences, two full stops, no comma in place of either.
- It is always a line of its own, set beneath the slogan. It never runs on after "live." on the same line, and it never appears without the slogan above it.
- It is set quieter than the slogan: smaller, lighter, and a step down in contrast. It supports the line, it does not compete with it. On the cover of this document it is a third of the slogan's size and a shade off white.
- Drop it, rather than shrink the slogan, wherever there is not room for all three lines: a one-line app store subtitle, a social bio, a favicon-sized space, a spoken read of under three seconds. The slogan alone is always correct; the sub-line alone never is.
- It carries the "all in one" idea the founder asked for, which is why that idea does not belong inside the slogan. "Everything you need" is the breadth, "One app" is the place, and together they say

what "all in one platform" says without using a phrase every large app claims.

Lines for specific jobs. Three runners-up, each kept for a place the slogan itself does not fit.

- *One home for you and your business.* A caption under a photograph, where the name is already on the page and the warmth of "home" carries the frame. It replaces the whole lockup in that frame; it is never stacked with it.
- *Your business lives here. So do you.* A two-beat line for film and audio, where the turn in the second sentence can land as a spoken beat; also right for a business-owner audience being shown the personal side.
- *Make yourself at home. Bring your business.* A welcome line for a new member, and a natural opening for a printed piece or a launch invitation.

4. The idea

Positioning, in one paragraph. For people who run something, and for everyone they deal with, Atwe is the one account where a person and their business live online. Unlike a stack of separate apps, the messages, the money, the shop, the jobs and the reputation are one connected thing, so nothing has to leave and nothing is typed twice.

Most people who work for a living use a dozen separate products to do one job: a messaging app to talk to customers, a payment app to get paid, a job board to hire, a shop platform to sell, a social network to be seen, a booking tool, an ad manager, an invoicing tool, a video call service. Each holds one slice of the same relationship, none of them talks to the others, and the person in the middle carries everything between them by hand.

Atwe's founding idea is that all of those slices belong together, because they are all about the same people. A customer is also a contact, also a follower, also a payer, also a reviewer. A supplier is also a message thread, also an invoice, also a connection. When the pieces live in one place, the product can do things a collection of separate apps never can:

- A conversation can carry a product, a quote, an invoice, a payment or a split bill as a live card inside the chat, not as a link to somewhere else.
- A payment can be held safely until both sides are satisfied, because the platform can see both the money and the order.
- An assistant can answer "who messaged me about the blue chairs, and did they pay?" because the messages, the listing and the wallet are all in reach.
- A reputation can be worked out from real completed dealings, not from a self-reported star count.
- A business and a creator can find each other, agree a deal and settle it without leaving Atwe.

Inside the company this advantage has a name: context. Context is the reason all of the above is true. It is never the word said in public; the public words are the slogan and the three pillars in Section 6.

5. Who Atwe is for

The primary audience is the person who runs something small. A trade, a shop, a salon, a restaurant, a studio, a practice, a freelancer. One owner, no IT department, and a working day that today runs across a stack of subscriptions that do not know about each other. Three moments in that person's own words, and Atwe's answer to each:

- *"A customer asked for a price on one app, paid me on another, and reviewed me nowhere."* On Atwe the quote is sent inside the conversation, accepting it makes the invoice, the pay button is in the same thread, and a completed dealing is what a review is tied to.
- *"I sent the invoice as a PDF and chased it by text for three weeks."* On Atwe the invoice is a card in the chat with a pay button on it, a due date, and a one-tap reminder you can send while it is unpaid.
- *"My shop, my till and my social account do not know about each other."* On Atwe they are one shelf: the storefront, the in-person till and a product tagged on a post all sell from the same stock, and the takings land in the same numbers.

The secondary audiences are the creator turning an audience into a business (subscriptions, tiers, pay-per-view, brand deals, a studio), and the two sides of hiring: people looking for work and the businesses hiring them, on a real two-sided jobs marketplace rather than a listings page.

The network is everyone those people deal with. Their customers, followers, friends and family, who arrive because somebody they deal with is already here, and who use Atwe to buy, book, message, pay and keep up without ever running anything. They are how Atwe grows, and they are welcome to use it as a plain social and messaging app.

A person and a business are the same kind of thing on Atwe: an account with a name and an @username. A business is not a separate page that someone manages; it is an account in its own right, which is what lets it message, sell, hire, post and be reviewed like any other member. The founder should confirm the primary audience above before the campaign is briefed; the product supports all three, and a campaign has to lead with one.

6. What to say, and what never to say

The promise is the slogan: Atwe. Where you and your business live.

Three pillars carry it. Everything else in this document is support for one of these three.

1. **One account, a person and a business alike.** No page to manage, one name, one feed, one shop, one wallet, one reputation. The proof: a business is an account; a quote sent in a chat becomes the invoice and the payment; a product tagged on a post, in a Daily or on a Short is bought from the same stock as the shop and the till.
2. **The money is safe.** A protected order holds the payment until the buyer confirms it arrived, and releases itself so a seller is never held hostage. Money is never invented: there is no coin, no token and no fake currency, a refund comes out of what was actually paid, and the refund paths are tested against one rule, that afterwards every balance, every held payment and Atwe's own take still add up to what was paid in. The only credits with no payer behind them are the rewards Atwe itself funds, a referral bonus or redeemed points, and each is a real ledger entry. Daily and weekly limits stand in the way of fraud.
3. **It works for you.** Atwe AI knows the whole product, reads your own account, answers "who messaged me about the blue chairs" from what it finds, and does anything a finger can do without a password, but only after showing you a card and waiting for you to confirm. It is not allowed to act on a stranger's words.

Claims a headline can carry. Each is one sentence, with the feature it rests on and the caveat that keeps it true. Write "on Atwe", not "only Atwe", unless the claim is about the combination or about a rule in Section 9; single pieces exist elsewhere, and what is Atwe's alone is that they share one customer, one wallet, one conversation and one reputation.

The claim	It rests on	The caveat
A person and a business are one account.	Account types (Section 5)	None.
Send the quote from inside the conversation. When they accept it, it is the invoice.	Quotes and invoices (10.4)	An invoice is paid by card through the card processor and the money lands in the issuer's Atwe wallet, less Atwe's share; it is not held the way a protected order is. An invoice can also be marked as settled outside Atwe, which moves no money and is a bookkeeping mark.
Buy with protection and the money waits until you confirm it arrived.	Protected orders (10.3)	Only a protected order, a booking deposit, a courier fee and the unclaimed part of a red packet (for up to 24 hours) are held.
Money is never invented here. No coin, no token, no points that are not a real balance.	Section 9	None.
Both the buyer and the seller approve the courier, or nobody moves.	Peer delivery (10.3)	Atwe is not the courier.

The claim	It rests on	The caveat
Tap the number and see what moved your reputation.	Reputation (10.9)	Everyone starts at 50.
The assistant shows you the card before it does anything, and a stranger's message can never make it act.	Atwe AI (10.8)	Say "is not allowed to act on a stranger's words"; do not say "cannot be hacked".
Secret chats are end-to-end encrypted, and Atwe tells you which chats are not.	Encryption (10.2)	Standard chats are not end-to-end encrypted.
Your till, your shop and your feed sell from one shelf.	The till and product tags (10.3)	The till records a card-machine sale; it is not a card reader.

Things never to say.

- Never describe the Atwe Card as available. It is coming, with a waiting list.
- Never describe the sales advance as available everywhere. It is switched on market by market, where lending is permitted.
- Never describe standard messaging as end-to-end encrypted. Secret chats are; standard chats are encrypted in transit and stored so they sync.
- Never say "ID-verified members" or "everyone here is verified". The identity label is granted by Atwe staff after a check; there is no automated document check.
- Never present Atwe AI as tax, legal or financial advice. It is a business assistant.
- Never say "Atwe delivers". A shop or a member delivers; Atwe holds the fee and the agreement.
- Never say "no fees". Atwe takes a share of sales, sells Pro and sells advertising. "No lead fees" is the only fee claim, and only about getting quotes from pros.
- Never say "pay in your currency". Prices can be shown in a currency for reading; charging is in the platform currency.
- Never say "available everywhere" about anything.
- Never quote user numbers, download counts or revenue. None are published.
- Never name the technology or any vendor behind Atwe AI. Atwe AI is Atwe's own assistant and is presented as such.
- Never name a competitor in public copy, comparative or otherwise, without legal review, and never claim Atwe "replaces" a named product. Say what Atwe does instead.
- Never say "new product" on 1 January 2028. The company is new; the product has been lived in for a year.

- Never show Beta or 26.8 in a campaign asset. Campaign assets carry 28.0.
- Never lead with price tests. A/B tests on a listing exist; showing different prices to different buyers is regulated in several places and is not a campaign message.

Things it is safe to say strongly. Everything in Section 10 is built and live on the web today, except the Atwe Card, which is a waiting list, the sales advance, which is switched on market by market, item authentication and the creator revenue share, which are built and switched on by Atwe rather than always on, and the few provider-backed parts Section 10 names, which switch on per deployment. Atwe is one account for a person and a business alike. A marketplace purchase can be made as a protected order, and Atwe holds the payment until the buyer confirms it arrived; booking deposits and delivery fees are held the same way. The assistant can act on your behalf and never does so without your confirmation. There is no fake currency anywhere in the product. The reputation is computed from real dealings and shows its workings.

7. What Atwe is instead of

For the agency's understanding only. Not for use as comparative advertising, and no named brand appears in public copy without legal review.

What most people use today	What Atwe does instead, connected
WhatsApp, Telegram, iMessage	Beam: every message, group, channel, call and file, plus the commerce cards and business tools none of them have
PayPal, Venmo, Cash App	The wallet: send, request, split, pool, pay links, invoices, quotes, gift cards, protected orders, cash out, and a card on the way
Shopify, Etsy, eBay, Amazon (as a seller)	Listings, storefront, marketplace, auctions, bundles, subscriptions, the till, delivery, labels, returns
Faire, Alibaba (for a small supplier)	Wholesale catalogues, volume pricing and net terms, on the same orders and invoices
Airbnb, Turo	Rentals with a real calendar, instant book, policies and refunds to the cent
LinkedIn, Indeed, Greenhouse	Jobs, applicants, pipelines, ranking by Atwe AI, recruiter projects, career pages, exports in the format recruiters' systems accept
Instagram, TikTok, X, YouTube	The feed, Dailies, Shorts, Live, the studio, the camera, the editor, creator subscriptions and the revenue share

What most people use today	What Atwe does instead, connected
Calendly, Square Appointments	Bookings from your real hours, deposits, an agenda, a calendar
HubSpot, Salesforce (small-business use)	Contacts, pipeline, lead lists, smart links, intent signals, inquiry forms, exports
Zoom, Eventbrite	Calls, meetings, breakout rooms, recording, webinars, events with tickets and door check-in
Fiverr, Thumbtack, Upwork	Services, provider pages, quotes from pros with no lead fees
Meta Ads, Google Ads (small budgets)	Advertise, promoted posts, sponsored listings, targeting, an Ads Manager
Patreon, Substack, Teachable	Subscriptions with tiers, pay-per-view, content packs, newsletters, courses
DoorDash, Uber (local delivery)	The shop's own delivery, and peer couriers with two-sided approval and held fees
Discord, Skool	Communities with roles, rules people agree to, owner insights, automatic moderation and a join fee
Slack, Notion (for a small team)	Group Cloud (notes, sheets, checklists, forms, rotas, expenses, a whiteboard) and topic threads inside big groups
Zapier, Make, a hired developer	A public API, webhooks, bots and mini-apps
A general-purpose chatbot	Atwe AI, which knows the product, reads your own data, and can act with your confirmation

The point is not the length of the list. It is that on Atwe these are not a stack of products stitched together; they are one product that shares a customer, a wallet, a conversation and a reputation across all of them.

How Atwe earns. Atwe Pro, a paid tier with real perks. Advertising: promoted posts, boosted jobs, sponsored listings and sponsored creatives, every one labelled. A share of marketplace sales. Premium @usernames, sold from the wallet. The sales advance, where it is switched on. Nothing is earned from a fake currency, and nothing is earned from members' messages: they are never sold and never used to target advertising.

Objections, and the answer. Five things a launch campaign will hear first, each answered from what is built.

- *"Jack of all trades, master of none."* Each part is built to the standard of the app it replaces, and Section 10 is the evidence; what none of those apps can do is share one customer, one wallet, one conversation and one reputation.
- *"Another everything-app."* No fake currency. No bot that reads a whole group. A security page that says in plain words what is and is not encrypted. A calm register rather than a loud one.
- *"My customers are not on it."* They arrive through you. A shared profile opens without signing in, a link pasted into any messaging app shows the person as a preview card, and a business phone number rings for a customer with no app. A quote, an invoice or a payment link asks the other person to join Atwe to accept or pay, which is how most customers arrive.
- *"Is my money safe with a company that started yesterday?"* Protected orders that release themselves, money that is never invented, daily and weekly sending limits, stated to the member the moment one is reached, and a test suite that asserts the sum.
- *"Who is behind it?"* The founder's answer, to be supplied for the brief.

8. The five worlds

The whole product is organised into five worlds, reached from one navigation bar.

World	What it is
Home	Your feed. Four tabs: For You (personalised), Following (chronological), Circles (industry feeds), Collections (your saved posts). Dailies live above it.
Beam	Messaging and calls. Every conversation, group, channel, community and call, plus the commerce cards that ride inside them.
Engine	Search and discovery. One search across people, posts, shops, jobs, services, businesses, industries, feeds, chats and groups, and across the app itself, with search operators for the people who want them. Businesses can be found by distance from where you are. Explore lives here.
Notifications	Everything that happened to you, each one opening the exact thing it is about.
Account	You. Your profile, your wallet and money tools, your shop, your customers, your marketing, your hiring, your orders, your planning, your creative tools, your settings.

Atwe AI is not a sixth world. It is reachable from a button beside the Engine search bar and from inside almost every other surface: the post composer, the chat box, the profile editor, the product form, the hiring pipeline, the shop. It is the same assistant everywhere, and it knows the whole product.

9. How Atwe behaves, and how it speaks

Atwe has rules it follows, and each is enforced in the software rather than written in a policy. They are the product's character, and the campaign can lean on every one of them.

Money is never invented. Every movement of a member's money is a transfer from somewhere to somewhere; the only exceptions are rewards Atwe itself pays for. Refunds come out of what was actually paid. Points and gift cards are real balances with real ledgers. There is no in-app coin, no token, no fake currency of any kind. A community boost buys a higher place in Discover and nothing else; a gift sent during a live is real money in the host's wallet.

Both sides are protected. A protected order holds the payment until the buyer confirms and releases it automatically so a seller is never held hostage. A courier is never told they have the job before the fee is secured, and gets the fee only when the buyer confirms it arrived, types the handoff code at the door, or lets three days pass without a word. A cancelled event refunds everyone. Where the sales advance is switched on, a quiet month repays it slowly.

Trust is earned from real events. A reputation is computed from completed dealings, never typed in, and the workings are visible. Certification is not for sale: it is earned at 90 or more with ten completed dealings, staff can grant or withhold it, and every such decision is logged.

The assistant proposes; the person disposes. Atwe AI never performs an action without a confirmation card, refuses anything that needs a password, and is not allowed to act on words a stranger wrote.

Honesty is stated in the product. The notice in every chat says plainly that standard messages are not end-to-end encrypted, and the security page says exactly what is. A highlight on a listing is derived from a fact Atwe holds, never written for effect. A count that could not be taken shows as a blank, not a zero. "Sent" is only ever said when something was sent. A feature that is built but not yet allowed says so instead of pretending.

It refuses the shortcuts. Some things Atwe will not do, even when they would be easy and profitable: no chart music behind someone's video without a licence; no third-party bot that reads a whole group; no captions stored without telling anyone; no message to a customer who asked you to stop; and Pro is cancelled from the plans page in one tap, and both the plan and the recurring charge stop at once.

It is designed with restraint. A black background by default, with a light theme that keeps every other rule. One white primary action per screen. Blue for identity, not decoration. Green for money and success, red for destructive, yellow for information. Full pills, no outlines, no emoji in the product's own words. Plain, calm copy. The Atwe mark is a swirl, and it is the only mark the product uses for itself, including for Atwe AI, where the rest of the industry uses a sparkle.

How Atwe speaks

Campaign copy follows the product's own rules without exception, because a member will see both in the same day.

Six rules.

1. Short sentences. If a sentence needs a second breath, it is two sentences.
2. Say the true thing strongly, not the big thing vaguely. "Send the quote from inside the conversation" beats "transform how you do business".
3. Volunteer the limitation before the reader finds it. It is why the product is believed.
4. The product is the subject, not the adjective. Atwe holds the payment; Atwe is not "a seamless payments experience".
5. No exclamation marks. Ever.
6. No questions the reader cannot answer. "Ready to unlock your potential?" is not a sentence a person can reply to.

Banned words. Revolutionary, game-changing, seamless, cutting-edge, unleash, empower, supercharge, next-generation, world-class, ecosystem, super-app, all-in-one (in a headline; it may sit in body copy), frictionless, disruptive, powerful (as a bare adjective).

Three rewrites.

- "Unleash your business potential with Atwe's all-in-one platform" becomes "Your till, your shop and your feed sell from one shelf."
- "Seamless payments you can trust" becomes "Buy with protection and the money waits until you say it arrived."
- "Next-generation AI that works for you" becomes "Ask Atwe AI who messaged you about the blue chairs. It looks, and it tells you."

The mechanics, which are not negotiable. No long dashes in anything Atwe writes; use a full stop, a comma, a colon or brackets. No emoji. No sparkle beside Atwe AI; the mark is the swirl. "Atwe AI" is always two words. The five worlds are Home, Beam, Engine, Notifications and Account, exactly. The named things are Dailies, Circles, Collections, Shorts, the till, Atwe Pro, Atwe Certified and Atwe Card, exactly.

Lines already in Atwe's voice. These may be used as written and must not be improved.

- Nothing had to leave Atwe, and nothing had to be typed twice.
- Money is never invented.
- The assistant proposes; the person disposes.
- A gift, never a stake.
- Both the buyer and the seller approve the courier, or nobody moves.
- Tap the number and see what moved your reputation.

- A business is not a page you manage. It is an account.
 - Atwe tells you which chats are not end-to-end encrypted.
-

10. Everything Atwe does

This section is deliberately complete. Atwe is a large product, and an agency planning its story needs to know its full extent before choosing what to say; the campaign should choose a few of these and say them strongly rather than repeat the list. An agency reading this for the first time will find the breadth hard to believe, which is a fair reaction. Every line in this section is built, is live on the web today, and can be opened at the address in the appendix, with the exceptions the text names where they appear: the Atwe Card is a waiting list, and the sales advance is switched on market by market. A few parts (shipping labels, carrier rates and sales tax, the business phone number, voice-note transcripts, live market prices and picture generation) are built into the product and run through an outside provider that Atwe switches on per deployment; without one, the feature says so and steps aside. Two more parts are built and switched on by Atwe rather than always on: item authentication and the creator revenue share.

10.1 Being seen: the profile and the feed

One page that answers the question every customer, employer and stranger has: can I trust this person, and what have they actually done?

The profile. A banner, a photo, a headline, a bio, a location, a website, a join date, and industries. Tabs for Posts, Replies, About, Media and Likes, with a Business tab for business accounts. A pinned post. Plain facts about a person (what they do, where they live, languages, how long they have been doing this) in a curated list that stays scannable. Work history, education, licences and certifications, skills with peer endorsements and quiz-verified skill badges, written recommendations with the subject's approval, a featured row and a portfolio ("Showcase") with likes and comments. A profile strength meter that nudges the next missing piece. A personal QR code, and a scanner. Three trust numbers together at the top: reviews, rating, and years on Atwe. A public Q&A on every business profile, with the business's own answer marked and shown first. A business picks the one primary button on its profile: Book, Order or Message.

Verification, layered honestly. A verified badge, a neutral silver seal, that a member applies for and Atwe approves; it marks an account Atwe has looked at, not a checked identity. Atwe Pro members carry a Pro badge beside their name. Business verification in levels, from documents to a premium seal, with a review step. An affiliation badge showing the organisation a member belongs to, granted by the business or approved by staff. An identity-verified label, separate from the badge, that Atwe staff grant after a check and that shows when and how it was checked; there is no automated document check today, and the label says out loud that a check has safeguards but cannot guarantee that

somebody is who they say. Workplace verification through a business email domain. An Open to Work ring on the photo, with a visibility control.

The feed. For You is ranked on engagement and recency and then personalised to the reader: their industries, the hashtags they follow, the authors they engage with and linger on (recency-weighted, so old habits fade), their recent searches, and their "Not interested" signals. A few fresh, low-engagement posts are woven in so new people get a chance. Same-author and same-topic posts are spread out. Following is purely chronological. The feed is endless and does not recycle what you saw in the last three hours unless that is all there is left to show. A new member is asked what brought them here, which topics to follow and which people, with starter packs per industry, so the feed reflects them from the first minute rather than after a week of guessing.

Posts. Text, up to four photos in a mosaic, video (long and landscape included), GIFs, polls, documents (a PDF, a deck, a price list), bold and italic, alt text written by hand or by Atwe AI, location, tagged people, up to five co-authors, and up to five of your own products tagged on the media so a reader can buy from the post. Threads of up to 25 connected segments. Articles: formatted long-form pieces published under your name, for the thinking that does not fit a post. Celebration posts for milestones: opened a store, a hire, an anniversary. Quote posts and reposts with attribution, and a quick quote straight from a saved post. An hour-long edit window with an "Edited" label. A ten-second undo after posting. Drafts saved to your account, and scheduling to a future time.

Reply controls (everyone, people you follow, only people you mention, verified accounts) are enforced by the platform, not just shown. One pinned reply per post. Translation into the reader's language, in place. Analytics on every one of your posts: impressions, unique viewers, engagements and a two-week trend. A post Atwe AI helped write can say so on the post, and the product can flag machine-made content; Atwe does not pass off generated words as a person's own. Any post can be rendered to a clean shareable picture in one tap ("Postshot").

Links that mean something. @mentions with autocomplete, #hashtags with their own pages, trending and follow buttons, and \$cashtags that open a live price page with a chart.

Dailies. Photo, video with its own audio, or text on a gradient. Several a day, each its own arc on the ring. A follower audience or a Close Friends list. Replies and quick reactions land as a message with a snapshot of the Daily. A seen-by list for the author. Highlights that keep a Daily on the profile after its 24 hours.

Shorts and video. Short photo and video posts in a full-screen vertical viewer with a like and dislike rail, comments, saves and a follow button. Discover Shorts surfaces good short content from outside your network. Playlists and series. Duet and stitch to remix another creator's video.

Live. Go Live to broadcast to viewers, with a proper studio console: switch what the audience sees (camera, screen, a product, a guest, a back-shortly card), pin one comment, bring a viewer on as a guest who must accept, and get a recap afterwards. Live shopping: pin one of your products and viewers get a buy card. Gifts during a live are paid from the wallet in real money and land in the host's wallet; there are no coins. Spaces: audio rooms with a stage, raised hands, and promote and demote.

Webinars and town halls: announced in advance, sign-ups free or paid, capped seats, a question queue the room upvotes, and everyone told the moment it starts.

Creative tools. A camera with ten colour looks applied live and five ready-made video templates (show a product, before and after, a day at work, how to, introduce yourself) with timed prompts. A video editor in the browser: trim, burn in a caption, remove a green background, nothing uploaded to be processed. A sound library with two honest sources and no third: your own audio, and a catalogue whose rights an operator has confirmed. There is deliberately no chart music. Make a picture from a description for a listing photo, a post or a banner. Tidy up a product photo: Atwe AI describes what it sees and redraws the item on a clean background, side by side, and you choose; it asks before ever redrawing a person.

Lists and Collections. Collections: your saved posts, kept in folders. Curated member lists with their own timelines. A history of posts you have read. Topic snooze (mute a topic for 30 days rather than forever). Tell the feed in plain words what you want more or less of.

The front door. A shared profile opens without an account: a stranger who follows a link, or finds a person through a search engine, sees the real profile before being asked to join. Every public place has a clean address (atwe.com/username, and the routes in the appendix). A link pasted into any messaging app or social network shows the person's name, photo and headline as a preview card.

10.2 Talking: Beam

Beam is a messaging app as good as the ones people already use, with one difference: a customer, a quote, a payment and an order can all sit inside the conversation.

Conversations. One-to-one messages with text, photos (albums stack one under the other), video, files, voice notes with automatic transcripts on both sides, GIFs, custom sticker packs and any-emoji reactions. Typing indicators, swipe actions on the chat list, mark unread and an unread-only view, @mentions inside groups, and a call log with missed and silenced calls. Several conversations with the same person, email-style, each with its own pin, mute, archive and draft. Message yourself as a notebook. Groups with multiple admins, rotating invite links, join approval, member management and topic threads for big groups. Channels (admin-post-only). Communities: an umbrella of groups with its own announcement channel. Broadcast lists that deliver as individual private messages. A separate requests inbox so strangers never land in your main list.

Every power feature. The features people expect from a messaging app are here, so moving a conversation to Atwe gives nothing up: replies with quoted context, forwarding with attribution, edit, delete for me or for everyone, pinned messages, starred messages across all chats, disappearing messages (24 hours, 7 days, 90 days), view-once photos and video, passcode-locked chats, scheduled messages, message search across everything and within a chat, colour labels and custom folders, wallpapers, silent send, per-chat sounds, live location for 15 minutes, an hour or eight hours, and static location, contact, event and poll cards. Chat export to a text file, with a per-chat setting that forbids it. Read receipts with a reciprocal privacy switch. Presence (online, last seen) visible to

everyone, connections or nobody, with the same reciprocity rule the best messaging apps use, plus the option to hide your last seen from one particular person from inside that conversation.

Group Cloud. Every group has a shared drive: folders and files, notes and sheets that two people can edit at once without losing anyone's work, checklists you can assign (with templates Atwe AI drafts, or tasks pulled from the group's own conversation), forms for inspections and incident logs, a shift rota, a team roster, an expense log, and a shared whiteboard. Forms and expense logs export to a spreadsheet.

Running a community. Custom roles with permissions per channel. Rules a member agrees to before posting, and a guided welcome for new members. The owner's own insights: who is active and who stays. Automatic moderation rules the owner sets, keyword and spam. A join fee, paid from the wallet. Community boosts that back a community with real money and buy exactly one thing, a higher place in Discover, with no fake currency attached.

Commerce inside the chat. These are the cards that make Beam different: a product you can buy, an order, an invoice with a pay button, a quote to accept, an offer to counter, money sent, a money request, a split bill share, a pool, a gift card, a digital download. All built by the platform from the real record, never by the sender, so a sender cannot forge one.

Calls. One-to-one voice and video that connect on mobile networks, not only on wifi. Group calls up to eight on video, audio rooms up to 32. Screen share. Breakout rooms. Live captions in a call, deliberately never stored. Call recording with transcripts, a summary, the points and who agreed to do what, with the other side told plainly and undismissably the moment recording starts; recording laws differ by place, and the person who records is responsible for having the right to. Shareable call links anyone can join. Scheduled meetings with reminders. Silence unknown callers: a call from someone you do not know never rings, and is still logged. A real phone number for a business so a customer with no app can still ring, with voicemail, texts and outbound calls from the business number.

Business messaging. Greeting and away auto-messages that respect business hours. Saved replies. Message templates. Interactive reply buttons and list pickers. In-chat forms a customer fills without leaving the conversation. A team inbox with assignment, so a business's messages route to the right staff member. Desks: the owner writes up to eight options in their own words (an order, returns, refunds), a customer picks one, and it goes to whoever handles it, with an instant reply per option and a fallback so a queue nobody watches can never swallow a message. Conversation analytics: response times, resolution, volume. Message insights. One polite automatic nudge for an abandoned cart, capped and easy to switch off.

Bots and mini-apps. Somebody else's software running inside a chat as a real account marked as a bot. It only sees chats it was added to, and in a group only hears messages that name it. A bot can be pinned to a place, a market, a venue, a campus, and appear only to people actually there.

Encryption, stated plainly. Standard messages are encrypted in transit and stored on Atwe's servers so they sync across your devices; Atwe can therefore process them for the features you use, such as transcripts, search and Atwe AI summaries, and it never sells them or uses them to target ads. Secret chats are end-to-end encrypted for one-to-one conversations: your device makes a key it will not hand

over, messages are scrambled before they leave, and what reaches Atwe is a blob it cannot read. Because the key never leaves that device, a Secret chat does not sync to your other devices and cannot be recovered if the device is lost. A public page at atwe.com/security says exactly what is and is not encrypted. Atwe does not claim more than it does.

10.3 Selling: the marketplace and your shop

Anyone with a username can sell, and a business gets a real shop: online, in person, and inside a conversation, from one stock.

Listings. Physical items, digital goods with instant delivery, services, and rentals priced by the night, day, week or month. Galleries, variants (size, colour) with their own stock and price, structured specifications and amenities, categories that turn a shop into menu sections, local pickup, delivery-promise dates ("arrives Tuesday to Thursday", counted in business days), returns policy windows, questions on a listing answered by the seller, and a highlights row (free returns, ships tomorrow, top-rated seller) that the platform writes from facts it holds, never from something the seller typed for effect.

The marketplace. Browse by kind, filter by price, rating and stock, sort by Best Match (relevance, quality, sales velocity, recency, seller trust), typo-tolerant search, and Browse by category with real examples under each tile. Sponsored listings are sold by auction: a seller names the most they would pay for a click and is charged only what it took to win, never more, within a daily budget that is spread across the day, and every one is labelled. Wishlists double as price-drop and back-in-stock alerts. Saved searches alert you when something matching appears. "N people have this saved" as honest social proof. Recently viewed at the top of Explore. Buy again from any past order.

Ways to buy. Buy now. A cart per seller with an address book, coupons, the seller's shipping options, live carrier rates and sales tax where they are switched on, and gift-card split tender. Make an offer and negotiate with counters. Auctions: name your maximum and Atwe bids only as much as it takes; a seller can set a reserve; a last-second bid extends the clock so nobody is sniped; the winner is handed a pay card in the chat at the winning price and pays to claim it, and an Ending Soon tab shows what is closing. Subscribe & Save for recurring delivery at a discount. Bundles priced as one. Pay with your wallet balance, a gift card, or a card.

Buyer protection. A protected order holds the payment until the buyer confirms it arrived. It releases automatically after a week so a silent buyer cannot trap a seller's money. Either side can open a dispute, and staff resolve it. For the things people fear buying from a stranger, and where Atwe has switched it on, an authentication step can sit on top of a protected order: the item goes to a checker before the payment is released, and a failed check refunds the buyer through the same held payment.

Fulfilment. A status timeline from ordered to delivered. Carrier and tracking with links. Multi-carrier shipping labels bought from the seller's wallet. Automatic "delivered" from the carrier. Packing slips. Confirmation emails. Returns with approve, decline, refund and restock, and optional prepaid return labels. Seller-issued refunds, full or partial, instantly. Order search across any shop's history.

In person. The till: sell to somebody standing in front of you from the same shelf and the same stock as the online shop. Ring it up, show a six-digit code, they pay from their Atwe balance, or record cash or a card machine. Atwe is not a card reader: a card-machine sale is recorded in the till, not taken by it. Takings land in the same sales figures.

Delivery. Peer delivery is built on one rule: both the buyer and the seller must approve the courier, separately, before anything moves. From a paid order, the buyer or seller posts a delivery, and anyone nearby can offer at their own price within sight of a suggested fee. The fee is held the instant both agree and released when the buyer confirms, or automatically after three days. A four-digit handoff code at the door. Live trip tracking with the distance counting down: the courier shares their position only for the trip, only with the buyer and seller, and it stops automatically at drop-off; the distance is worked out on the watcher's own phone, so the watcher's location is never sent anywhere. A chat between all three parties and a tip afterwards. Delivery instructions saved per address. A needed-by window. The courier is rated like everyone else, and it moves their reputation. Atwe is where the buyer, seller and courier agree and where the fee is held; it is not itself the courier. A shop can also run its own local delivery: set an area, a fee, a free-over threshold and a rough time, and buyers inside it see it at checkout with the distance shown.

Rentals. An availability calendar that cannot be double-booked, host-blocked dates, instant book per listing, weekly and monthly discounts, guest counts and cleaning fees itemised honestly, and flexible, moderate or strict cancellation policies with refunds to the cent.

Running the shop. A storefront with themes (a feel, a layout, a colour, a tagline), the Manage store hub, coupons, bundles, vacation mode, holiday hours, A/B tests on a listing's title or its price, bulk listing tools with spreadsheets in and mass edits, multi-location inventory per branch, a live catalogue feed for the big shopping and social ad platforms (a feed out, not an integration or a partnership), an international shipping option, and sales analytics: revenue, units, what needs shipping, top products, trends, and custom report exports. Marketing automation: message the customers who bought, who bought once but not for six months, who saved an item, one a day at most, never to anyone who asked you to stop, and see what it was worth afterwards. Offers to watchers. Photo-to-listing: snap a picture and Atwe AI drafts the title, description, category and price.

Selling to other businesses. A business catalogue with volume pricing and net payment terms, so a supplier, a distributor or a trade sells to other businesses on terms, on the same orders, invoices and protection as a sale to a consumer.

Services. A first-class service profile with a category, an area and a rate, contact by chat, and a provider page that answers "can this person do the job?" from real dated history and verified skills. Get quotes from pros: post what you need once, every pro in that category gets the lead free and answers with a real quote, and only the customer sees them side by side. Atwe charges no lead fees.

10.4 Getting paid: the wallet, money tools and the creator layer

Every account has a real balance, and sales, tips sent from a wallet, deposits, splits, pools, payment links and courier fees land in it.

The wallet. Every account has a balance with a full ledger. The balance is money Atwe holds for you inside the product; it is not a bank account and it earns no interest. Add money by card. Send money to any @username, instantly from your balance, within daily and weekly limits. Request money. Cash out to a bank account, where the payout partner supports it. Pots with goals, for setting money aside. Card payments, top-ups and payouts to a bank run through a regulated card and payout processor; the wallet ledger is Atwe's own.

Getting paid for work. Quotes: an itemised proposal the customer accepts or declines before work starts; accepting turns it into an invoice automatically. Invoices with due dates and a pay button inside the conversation, paid by card; the invoice is marked paid, you are told the moment it is, and the money arrives in your wallet balance ready to spend or cash out. An invoice settled outside Atwe can be marked paid without moving money. Payment links, fixed or open amount, to share anywhere. Split a bill across up to twenty people, equally or by share. Money pools for group fundraising toward a goal. Scheduled payments, once or recurring, with pause and retry. Tips.

Money between people. Red packets: drop a lump sum into a group and members grab random shares, one each, luckiest crowned, unclaimed money home after 24 hours. Nobody pays to take part: one person gives, members receive, and no share can be lost. A gift, never a stake. Gift cards as a separate balance that can be sent, claimed, moved to the wallet or spent at checkout alongside it. A "do you know this person?" pause before the first payment to a total stranger, so a scam has to survive one honest screen.

The creator layer. Creator subscriptions, recurring and monthly, with real card billing and cancel-at-period-end. Up to five priced tiers, where a higher tier unlocks more. Subscriber-only and tier-gated posts, shown as locked teasers on the profile and kept out of the public feeds. Pay-per-view: unlock a single post for a price. Content packs: several posts sold together as one, free or paid. A group or community can charge a join fee. Gifts during a live, paid from the wallet in real money. The creator revenue share, once Atwe switches it on: a fixed share of Atwe's own advertising revenue paid back to creators each month, split by genuine attention, written down first and paid separately so nobody is ever paid twice, with the share shown to every creator in their own earnings view. The studio: a creator's money, reach, best posts and what is waiting on them, in one screen.

Working with creators. A brand-deal marketplace: a business posts what it wants made and what it pays, creators pitch, one is picked, which closes the brief and opens a conversation, and the money runs on the same invoice flow as everything else. Samples: a seller sends a creator a product to try and tracks it through offered, accepted, sent and posted, with the resulting post linked.

Rewards and growth. Loyalty points at roughly one percent back on purchases, with tiers and redemption to wallet credit. A referral programme that credits both sides. A business referral engine that rewards a business for bringing its customers and suppliers along. Reserved and short @usernames can be offered for sale and bought from the wallet, the name switching over the instant it is paid.

Atwe Pro. A paid tier with real perks: a year of numbers against thirty days, longer Atwe AI answers, ten scheduled AI tasks against two, a longer memory, the Pro badge, and a monthly free boost. Each of those is enforced on the server. Seeing who viewed your profile is listed as a Pro perk in the app

and is not gated yet, so today every account sees the names; it is a switch waiting to be turned on, not a promise the product breaks.

Capital. An advance against sales already made, repaid as a fixed share of each sale that follows, so a quiet month repays slowly. It is built and proven end to end, and it is switched on market by market, only where lending against future receipts is permitted.

Atwe Card. Atwe Card will be a debit card tied to the wallet balance. Today the card surface is built and takes a waiting list; the card programme depends on an issuing partner and identity checks and is not yet live.

Safety underneath all of it. A double tap does not charge twice, and neither do two servers handling the same payment at the same moment. A card payment reported twice by the card network is counted once. Daily and weekly sending limits stand in the way of fraud, and a wallet can be frozen while a fraud case is looked at. The refund paths are tested against one rule: afterwards, every balance, every held payment and Atwe's own take must still add up to what was ever paid in.

10.5 Hiring and getting hired

A real two-sided jobs marketplace, with the tools an employer pays a recruiting system for, and real tools for the candidate too.

For employers. Post a job with industry, location, remote, salary and hours. Screening questions with knockout logic and automatic meets-or-missing flags. An applicant pipeline (applied, reviewed, shortlisted, rejected, hired) with candidate notifications and bulk moves. Atwe AI ranks every applicant with a reason and a fit score, and never rejects anyone on its own. Job analytics: views, apply rate, trends. Boosts for featured placement. Recruiter projects: shared candidate pipelines with notes for a hiring team. Saved candidates. Lead lists with alerts when a prospect posts, hires or launches. Advanced people search stacked by title, industry, years and education. Exports in the column format the common recruiting systems accept on a bulk import, plus webhooks so an outside system keeps in step by itself. Career pages: a business's jobs, culture posts and team in one tab. Company insights: headcount trend and hiring pace on a business's profile.

For people looking. Search and filters, saved jobs, job alerts, an applied tracker with live status. Easy Apply with a saved resume and a cover note Atwe AI can draft. "How you match": a score against any job with the skills to highlight. Interview prep: likely questions, tailored tips, and questions to ask them. Salary insight against peers. An Open to Work listing and ring. A guided resume builder that turns your real profile into a printable CV. Ask a connection who works there for a referral, from inside the job. Verified job postings from verified businesses.

The graph underneath. Follows, mutual connections with degrees (1st, 2nd, 3rd, "via Sarah"), people you may know, who viewed your profile (with the honest reciprocity rule: browse privately and you cannot see who viewed you), starter packs of people to follow per industry, and an Atwe AI matchmaker that pairs jobs and workers with an explanation.

10.6 Running the business

Everything a small business pays six subscriptions for, on the same account as its customers.

One dashboard. Everything that needs your attention in one place: orders to fulfil, booking requests, new applicants, reviews to answer, unpaid invoices, open quotes, upcoming events, students, and a Manage section into every part of the business.

Bookings and appointments. Bookable services with durations, open slots generated from your business hours, deposits held until the job is done, confirm and decline, completion that releases the deposit. Business hours with a live open or closed badge and dated exceptions for holidays. A unified agenda of appointments and events. A "Your day" view.

Customers. A contact book with detail cards, and a list of who has saved you. A lightweight CRM with leads, deals and a pipeline. Buyer-intent signals: accounts that have viewed your profile or a listing, saved an item or left one in a cart; a member browsing privately is never recorded as a profile viewer, and nobody's search words are ever shown. Smart links that show who viewed what. Profile inquiry forms with fixed answer choices (a make, a model, a year) so every enquiry arrives as a clean lead. Instant availability answers so "do you have X?" gets a straight answer at two in the morning. Export your customer list, with how many orders and what they spent, to any spreadsheet or CRM. Outreach drafts by Atwe AI, grounded in a lead's real profile.

Team. Invite staff with roles (admin, manager, staff) and granular permissions over jobs, Q&A, orders and reviews, acting as the business. Account switching without logging out, for an owner who is also a person.

Marketing. Every way to reach people who are not yet customers, paid from the same wallet and measured in the same numbers as your sales: sponsored creatives that link out, reviewed and paid, with impressions and clicks; promote a post into others' feeds, labelled as an ad; boost a job; sponsored listings in the marketplace; audience targeting by industry, place and interest; an Ads Manager across all of it; premium placement in the directory; broadcasts to your audience; affiliate links on every product with commission on attributed sales; the affiliation badge for your people; newsletters, free or paid, with issues that notify subscribers; webinars as a channel; and the brand-deal marketplace in 10.4, for hiring a creator and paying them through the same invoice.

Analytics. Business analytics: profile reach, followers, connections, post reach, hiring numbers, product-tag taps. Seller analytics. Conversation analytics. Custom report exports. And an analyst view where you ask Atwe AI "why are sales down this week?" and it answers in words, with a chart when the answer is numbers.

Connecting other systems. If you already run something else (accounting, a warehouse, a booking system), Atwe can talk to it: a business gets its own keys, chooses exactly what each one may see, and is told the moment an order is placed, paid or shipped, a listing is added, a review lands, or an applicant applies or moves, so the other system keeps in step by itself.

10.7 Learning and gathering

Teach, host and gather on the same account, with money handled the same honest way.

Courses with modules and lessons (video and notes), free or paid from the wallet, progress tracking, and a teaching tab on your profile. Events with RSVPs, capacity, paid tickets, attendee lists, calendar export, and QR check-in at the door with one green tick per ticket. Webinars and town halls.

Newsletters. Communities, and industry Circles, which are Atwe's own: fixed, company-defined industry feeds that anyone can join and nobody can fake. Cancelling a paid event or webinar, or removing a course, refunds everyone automatically; a ticketed event cannot be deleted at all, only cancelled, so nobody's money can vanish.

10.8 Atwe AI

An assistant that knows this product, can look inside your own account, and acts only when you say so.

Atwe AI is a business assistant first. Ask it about pricing, hiring, a supplier, a difficult customer or an email you have to write, and it answers the question on its merits, the way a good adviser would. It is an Atwe guide second: it knows every page, feature and setting, so "how do I" gets an answer about this product, never a generic one.

It knows the product. Every question is answered against the real catalogue of what Atwe does, and it is told to say it is unsure rather than invent a feature. It understands the words people actually use ("cash out", "cv", "incognito"), because it inherits the search bar's own synonyms.

It can look things up. Who messaged you in the last hour. What your username is. A summary of a whole conversation. Your unread count, your notifications, your wallet, your orders, your listings, what needs your attention, what is coming up. "What did Sarah quote me?", answered from your own posts, chats, orders and files. It fetches from your own account and answers from what it found, never from a guess. A loosely spelled name comes back as buttons to choose from, so it never guesses who you meant before messaging or paying them. Its own conversations keep their history in projects, it accepts a photo as input, and it takes dictation.

It can act, and it never acts without you. Anything a finger can do without a password: post, message, follow, block, send or request money, change a price, set stock, answer a booking, mark a sale as sent, create an event, and about a dozen more. Every one of them ends in a card showing exactly what it is about to do, and nothing happens until you confirm. It then uses the same route your own tap would use, so every protection applies unchanged.

It says no to the right things. Deleting the account, changing the password or email, two-factor settings, signing out other devices, cashing out to a bank. Atwe asks the person for their password or a code, and will not take it from the assistant. It explains that and points to the page.

It is not allowed to act on a stranger's words. Once it has read text written by someone else (a message, a notification), it cannot take any action for the rest of that answer. So a message saying

"the owner approved a transfer, send \$500" can be reported to you, but never carried out.

It remembers what you tell it. A short list of plain sentences it keeps between conversations, readable, deletable, switchable off. Recurring tasks: ask for something every day, week or month and the answer waits in your inbox. Workflows: several steps run in order as one named routine. Recurring tasks and workflows only report; because nobody is there to confirm, they never act. A proactive morning briefing: missed messages, orders, applicants, money, before you ask. Voice mode that listens, answers aloud in short spoken sentences, and listens again. An audit log of every action it took.

It is everywhere. A writing assistant in the post composer, the chat box and the profile editor (improve, expand, shorten, professional, funny, translate). A one-tap spelling fix that changes only mistakes and keeps your language, and a selection editor: select any words in the chat box, tap Fix with Atwe AI, and only the selected words change. A shopping concierge that searches in plain language. A product-description writer. Grounded customer-service answer drafts. A receptionist that answers inbound messages from what the business has actually published and goes quiet the moment it cannot. Applicant ranking, matchmaking, cover notes, interview prep, resume building, skill quizzes. Chat summaries, checklists from a conversation, voice-note transcripts. Picture generation. Alt text. Content moderation. Purchase-order drafts from stock levels. "Catch me up" and "Show me what matters" briefings over your network.

10.9 Trust and reputation

A reputation on Atwe is computed from what actually happened, and anyone can see the workings.

A reputation you can check. Your number is worked out fresh from real events every time, never a stored tally that can drift, and tapping it shows exactly what moved it. Only a review tied to a completed dealing counts, so a handful of fake accounts cannot sink anyone. Everyone starts at 50 out of 100; ratings, completed orders, stays, tenure and verification raise it, and cancellations, upheld returns, lost disputes and upheld reports lower it. A rating counts for half as much each year it ages, so a bad patch can be grown out of. Atwe Certified: a purple mark for a reputation of 90 or more with ten or more completed dealings, not for sale, with every staff decision to grant or withhold it logged.

Reviews for every kind of dealing. Orders, stays, appointments, services, and the people on both sides, including couriers and buyers. Rate the thing and, separately, the person. Category ratings that say why (cleanliness, accuracy, punctuality, as described, delivery). A star breakdown. Photos and video on reviews. How long each reviewer has been on Atwe under their name. Topic chips mined from what people keep mentioning, as counts, never verdicts. A one-sentence summary of what reviewers actually say, shown only once there are enough reviews to be honest. A "reviews to write" list of everything still owed.

A marketplace trust score from tenure, completed orders, ratings and verification, shown as a shield on the profile.

Reporting and moderation. A full report-reason list on posts, listings, jobs, people and videos. Automatic moderation on posts. A content scanner staff can run over posts, listings, profiles, ads and group and channel messages; it never reads one-to-one messages. A moderation queue, appeals from the login screen for suspended accounts, suspensions that lift on time, bans, and instant session revocation. Community notes for context on viral posts. An about-this-account panel with join date, region and name changes.

10.10 Privacy and security

You decide who sees you, and you can leave with everything you brought.

Getting in. Two-factor authentication with recovery codes. Passkeys: sign in with your face, fingerprint or device PIN, phishing-resistant by design. Every logged-in device listed, with an approximate location and last seen, and any of them revocable. Sign-in alerts by email. Link a new device by QR code. An app lock with a passcode, and separate locks for the wallet and the shop. Google and Apple sign-in.

Who sees you. Who sees you online, who can see your connections, who can send you requests, who can add you to groups, and whether the feed personalises to you at all. Private profile browsing. Blocks that work in both directions everywhere. Muted accounts and muted words. Notification preferences per category, quality filters that quiet strangers and new accounts, and quiet hours.

Leaving. Download your data as one file. Hibernate the account reversibly, or delete it, with a tracked data-request record and a legal deadline. A public security page that says what is encrypted and what is not.

10.11 Where Atwe runs

The web app is the whole product today; the phone apps are the same product being finished for the beginning of 2027.

The web app at atwe.com is the full product, and it installs as an app: on a phone from the browser's share sheet, and on a Mac or PC with its own window, its own title bar, a badge on the dock or taskbar when something is waiting, keyboard shortcuts, and Atwe links opening in it. It notifies you when it is closed, on a phone or a computer, and what you read on one device is read on all of them; someone away for a few days gets one summary of what they missed, never a stream. It works offline for what is safe to queue and sends it when the connection returns. The interface can be set to any of 14 languages, including right-to-left Arabic and Hebrew; the most-used screens and actions are translated and anything not yet translated shows in English while coverage grows. Prices can be shown in your own currency for reading, labelled as such; charging happens in the platform currency. A black theme and a light theme with a custom accent colour, with accessibility built in: focus rings, screen-reader announcements, larger text, reduced motion, and a checked colour palette.

The iPhone and Android apps are one codebase, built native. On iPhone the app requires iOS 26 and uses the platform's own glass materials. Today the apps are 26.8 Beta; the iPhone app has been through TestFlight and the current build is waiting on build credits, and Android has not yet been

handed to testers. Working today on the phone: creating an account, sign-in with two-factor, Home with all four tabs and Dailies, one-to-one chats, search across every scope, marketplace browsing, Atwe AI with confirm-first actions, the wallet (send, request, add, cash out), orders and native push. Still to finish: groups, media, reactions and calls in Beam; buying inside the app; storefront management and business analytics; Apple Pay; home-screen widgets; and the public App Store listing, which waits on Apple approving the company's own developer account (the upgrade from the founder's individual account to an organisation one, which needs the company to exist first). Android builds from the same code and needs a Play developer account, not more code.

Behind it. Photos, video and documents can live on a content delivery network. The direct-upload path that a long film needs is built and carries a two gigabyte, three hour ceiling; today the surfaces a member posts video from still use the older path, so in practice a clip is capped at sixteen megabytes until those are moved across. Every fault a member hits is reported to the operator as the screen, the error and the build, with no page address, no message text and no names in it, and every server error carries a short reference the member can quote.

How it is checked. Standing checks run on every change: sixty screens are opened in both themes and any text below the readable floor fails; controls across the most-used surfaces are measured against the 44-point touch minimum on a phone and a tablet, and a control that would steal its neighbour's tap fails; a real sale, a real call and a shared photo are driven end to end between two accounts; every request carries a deadline so a lost signal cannot freeze a button; scrolling is measured under a throttled processor; and no long dash can reach a member from anything Atwe wrote.

11. Names, words and facts

Company. Atwe Inc. The official launch of the company as a brand, with its marketing campaign, is 1 January 2028.

Product. Atwe. Domain atwe.com. The domains atwe.app, atwe.co and atwe.ai all lead to atwe.com. The staff dashboard is admin.atwe.com and opens only to a staff sign-in.

The name. Written Atwe: a capital A, then lower case. The all-capitals form belongs only inside the wordmark, if the founder wants it there. The possessive is Atwe's; there is no plural. How the name is pronounced and where it comes from are the founder's to state, and the first question in the list below; a launch campaign for a name nobody has heard is largely a campaign to teach the name.

The five worlds: Home, Beam, Engine, Notifications, Account. Use these names exactly.

The assistant: Atwe AI. Always with the two words. Atwe AI is Atwe's own assistant and is presented as such; no third-party model or vendor is ever named or implied in the product, and the campaign follows the same rule.

The named things. Stories are Dailies. Industry feeds are Circles. Saved posts are Collections. Short video is Shorts. The in-person checkout is the till (lower case in prose). The paid tier is Atwe Pro. The certification mark is Atwe Certified. The card is Atwe Card. The shared drive in a group is Group Cloud. The owner's shop hub is Manage store. The discovery page inside Engine is Explore. The job-seeking flag is Open to Work. End-to-end encrypted conversations are Secret chats.

Version numbering follows the year, the way a phone's does: the apps say 26.8 Beta today, will say 27.0 at the public release at the beginning of 2027, and 28.0 when Atwe Inc begins on 1 January 2028. The web app shows no version at all, because a website is always the newest one.

Two dates, and they are different things:

When	What
Now (September 2026)	The web app is live at atwe.com and real people use it. This is wanted, not tolerated, and it is not the public release. The iPhone app has been through TestFlight and the current 26.8 Beta build is waiting on build credits; Android builds from the same code and waits on a Play developer account.
Beginning of 2027	The official public release of the product. Web, iPhone, Android and desktop, all done and available to everyone. Version 27.0, and the word Beta is dropped.
2027	A year of real members. Real usage teaches what no test can, and the team fixes what real members find.
1 January 2028	Atwe Inc officially begins, with the marketing campaign. Version 28.0. Treated as a new company brand even though the product will have been lived in for a year.

How to talk about the timeline in public. The product has been used by real members since 2026. The company launches on 1 January 2028 with a product that has already been lived in. Say "a year of real members", never "a year of fixes". The company is new; the product is not. Every campaign asset shows 28.0 and never Beta. The beginning-of-2027 release is "available on every platform", never "launch"; the launch is the company's, in 2028.

Assets. The Atwe mark is a swirl; the mark and icon files, the type (Inter, with a system fallback), the colour tokens exactly as Section 9 lists them, and the design rules document are supplied with this brief, and the design rules document is the authority. The mark is never redrawn, never given a sparkle, and never shown in blue as an action.

The campaign. The fields below are the founder's to fill before the agency starts, and they are left blank here on purpose rather than guessed at: the objective (awareness of the company, sign-ups, sellers, hirers); the markets on day one, and in which of them the sales advance is switched on; the channels; the budget band; what a good result looks like on 1 February 2028; and who signs off copy, and how fast.

Questions for the founder. How is Atwe pronounced, and where does the name come from? Which audience leads? Which countries on day one? May named competitors appear in public copy after

legal review, or never? Is the founder the face of the campaign? Is there a launch offer (referral credit, an Atwe Pro trial, waiting-list priority for Atwe Card)? What does "Atwe Inc officially begins" mean concretely on the day (incorporation, offices, a team announcement)? Who is behind it, in the founder's own words, for the objections list in Section 7?

12. Appendix: the complete map of the product

This is the definitive list of names and public addresses, so that a landing page, a QR code or a deep link in an ad points at a real place. It is the app's own table of contents, as its search index lists them, not a summary.

Worlds and doors: the five worlds, Home · Beam · Engine · Notifications · Account; and the doors, Atwe AI · Your profile · Add account · Settings · Help & feedback · Log out

Home: For You · Following · Circles · Collections · Write a post · Add to your Daily · Go live · Tune your feed

Beam: New chat · New group · Starred messages · Broadcast lists · Chat labels · Auto-messages · Calls · Contacts

Engine and Explore: Marketplace · Jobs · Services · Browse by category · Businesses · Events · Courses · Webinars · Bots · Circles · Shorts · Find workers · Shop with Atwe AI · Communities · Newsletters · Showcase

Account · Profile: Edit profile · Manage plan · Get verified · Verify your business · Verify your identity · QR code · Who viewed my profile · My network · Starter packs

Account · Money: Wallet · Add money · Send money · Money requests · Invoices · Quotes · Split a bill · Money pools · Scheduled payments · Payment links · Gift cards · Atwe Card (waiting list) · Rewards · Invite friends · Get a handle · Help & refunds

Account · Selling: Business dashboard · My listings · Manage store · Your storefront · The till · Pay at a till · Local delivery · Business phone number · An advance on your sales (market by market) · Export your customers · Team

Account · Customers: Customer inbox · Sales pipeline · Message your customers · Smart links · Interested in you · Message insights · Saved replies & forms

Account · Marketing: Advertise · Ads Manager · Sales & analytics · Business analytics · Affiliate program · Affiliation · Your broadcasts · Webinars

Account · Jobs & hiring: Post a job · Jobs I posted · Saved candidates · Recruiter projects · Lead lists · My applications · Saved jobs · Job alerts · Resumes · Open to Work · My services

Account · Orders & saved: Daily archive · Lists · Orders · Offers · Reviews to write · Deliveries · Deliver for others · Cart · Bookings · Saved items · Subscriptions · My courses · Newsletters · Showcase · Addresses

Account · Planning: Calendar · Appointments · Events · Your day

Account · Creating: Your studio · Brand deals · Samples · Camera looks · Sounds · Make a picture · Bots · Call recordings

Account · Atwe AI: Talk to Atwe AI · Memory & tasks · Do it for me

Settings: Your account (display name, username, email, birthday, change email) · Security & access (password, passkeys, two-factor authentication, devices & sessions, linked devices, locked sections) · Privacy & safety (who can contact you, read receipts, active status, hidden from, private profile views, blocked accounts, muted accounts, muted words) · Notifications (push, categories, quality filters, quiet hours) · Premium (your plan, verified badge, creator subscriptions) · Display & accessibility (appearance, accent colour, language, currency, larger text, reduce motion) · Atwe Assistant, the Settings page for Atwe AI (ask about your data, active model, share conversation, clear chat history) · Your data & storage (posts you have read, download your data, delete account) · About (what's new, privacy policy, community guidelines, terms of service)

Public addresses (each of these is a real, shareable link): atwe.com/ username · atwe.com/username/post/id · /messages · /search · /ai · /notifications · /me · /settings · /devices · /help · /network · /jobs · /job-alerts · /resumes · /businesses · /services · /events · /courses · /newsletters · /communities · /showcase · /marketplace · /cart · /orders · /saved · /collections · /subscriptions · /addresses · /bookings · /wallet · /money-requests · /invoices · /quotes · /payment-links · /gift-cards · /rewards · /referrals · /dashboard · /store · /listings · /analytics · /ads · /affiliate · /team · /calendar · /appointments · /group/ name · /circle/ name · /job/ id · /listing/ id · /event/ id · /security

This document describes the product as built and live in September 2026. It is maintained alongside the product and is re-issued rather than edited by hand when the product moves.

Atwe. Where you and your business live.

Everything you need. One app.
