

Atwe — Your Setup Checklist

Everything that needs you, and nothing that doesn't.

Atwe is built and working. This document is the short list of things only you can do — accounts to open, keys to paste — plus the handful of features that are genuinely blocked on the outside world rather than on more building.

Build 1648 · 505 features, 497 built and verified · 22 things for you

Live checklist: your admin dashboard → **Setup**

Read this first

Every connection below is **optional**. Without one, Atwe keeps running — it just quietly does less. That "quietly" is exactly the danger: payments look like they work when the money is pretend. This list makes each silence visible.

Where the keys go — the same 5 steps every time

- 1 Open **railway.app** and sign in.
- 2 Click your Atwe project, then the service running the app.
- 3 Open the **Variables** tab.
- 4 Press **New Variable**. The name is the `CAPITAL_LETTER` one from this document; the value is what the provider gave you. Paste it exactly — no quotes, no spaces.
- 5 Railway redeploys on its own. Wait about a minute, then open your admin dashboard → **Setup**. The light should be green.

If it doesn't turn green: the name is usually misspelled, or a space crept in at the end of the value. Nothing is broken — the feature simply stays off until it matches.

The database is not on this list — Railway wires that up on its own, so there is nothing for you to do there.

A word on safety: these keys are passwords. Keep them in Railway, never in a message, an email, or a screenshot.

1 · Do first — before real members

Until these four are done, Atwe is a very convincing demo rather than a real product.

☐ Sign-in secret

DO FIRST

Turns on Signs everybody's login so it can't be forged.

Without it An insecure development value is used and every session breaks on restart. Must be set before real members.

Where Invent one long random string and paste it into Railway → Variables.

Paste as JWT_SECRET

☐ Site address

DO FIRST

Turns on Correct links in emails, share links, QR codes and the product feed.

Without it Links in emails point nowhere useful.

Where Set it to https://atwe.com in Railway → Variables.

Paste as APP_URL

☐ Card payments (Stripe)

DO FIRST

Turns on Real card payments: topping up a wallet, Atwe Pro, event tickets, paid subscriptions, boosts.

Without it Every payment is a DEMO grant — the money is pretend. Fine for testing, never for real members.

Where stripe.com → Developers → API keys. Then add a webhook to /api/billing/webhook and paste its signing secret. Turn Connect on in the same dashboard for cash-out to bank.

Paste as STRIPE_SECRET_KEY STRIPE_WEBHOOK_SECRET STRIPE_PRICE_ID

☐ Sales tax

DO FIRST

Turns on Tax added at checkout and recorded on the order.

Without it Every order charges zero tax. Legal exposure once you sell for real.

Where Simplest: SALES_TAX_RATES as a small JSON of region → rate. Or plug in a tax API.

Paste as SALES_TAX_RATES SALES_TAX_RATE TAX_API_URL TAX_API_KEY

☐ Email

DO FIRST

Turns on Verification links, password resets, order confirmations, shipping updates, sign-in alerts, your broadcasts.

Without it Every one of those is written to the server log instead of sent. Nobody can reset a password.

Where Any SMTP provider (Resend, Postmark, SendGrid, Gmail app password).

Paste as SMTP_HOST SMTP_PORT SMTP_USER SMTP_PASS MAIL_FROM

2 · Do soon — big capability, still just a key

None of these break anything today. Each one switches a large part of Atwe from off to on.

☐ Cash out to a bank (Stripe Connect)

DO SOON

Turns on Members move their Atwe balance to a real bank account.

Without it **Cash-out is a demo: the balance drops but no money leaves.**

Where Same Stripe account — enable Connect (Express accounts).

Paste as `STRIPE_SECRET_KEY`

☐ Atwe AI

DO SOON

Turns on Everything AI: the assistant, writing help, job matching, resumes, moderation, summaries, the shopping concierge, agent actions.

Without it **Roughly 25 features say "not set up on this server". The single biggest switch on this page.**

Where console.anthropic.com → API keys.

Paste as `ANTHROPIC_API_KEY`

☐ Push notifications

DO SOON

Turns on Alerts on a phone when the app is closed — messages, orders, money.

Without it **Notifications only appear while a tab is open. The come-back-to-Atwe nudge never sends.**

Where Generate a VAPID key pair (npx web-push generate-vapid-keys).

Paste as `VAPID_PUBLIC_KEY` `VAPID_PRIVATE_KEY` `VAPID_SUBJECT`

☐ Photo & video storage

DO SOON

Turns on Photos and video live in proper storage: big uploads, long video, fast loading worldwide.

Without it **Media is stored inside the database as text. It works, but it is capped small (~16MB) and gets slow as it grows. Worth doing before you have many members.**

Where Cloudflare R2 or Backblaze B2 (both cheap, S3-compatible). Point CDN_URL at the public bucket.

Paste as `S3_BUCKET` `S3_ACCESS_KEY` `S3_SECRET_KEY` `S3_ENDPOINT` `S3_REGION` `CDN_URL`

☐ Calls that connect anywhere

DO SOON

Turns on Voice and video calls that work on mobile networks and behind office firewalls.

Without it **Calls fall back to a free public relay — they often fail to connect on 4G/5G. The most common "calls don't work" cause.**

Where Cloudflare dashboard → Calls → TURN. Free tier is generous.

Paste as `CLOUDFLARE_TURN_KEY_ID` `CLOUDFLARE_TURN_API_TOKEN`

3 · When you need it

Genuinely optional. Atwe works properly without every one of these.

☐ Currency conversion

WHEN YOU NEED IT

Turns on The currency picker offers more than dollars (display only — charges stay USD).

Without it **Members only ever see US dollars.**

Where FX_RATES as JSON, e.g. {"EUR":0.92,"GBP":0.79}. Refresh it when you like.

Paste as `FX_RATES`

☐ Making pictures

WHEN YOU NEED IT

Turns on Generate a picture from words, and "tidy up" a product photo.

Without it **Both say they are not set up. (The consent step for photos with people in them lives here too.)**

Where Any image API that takes a prompt — the code is provider-agnostic.

Paste as `IMAGE_API_URL` `IMAGE_API_KEY`

☐ Voice-note transcripts

WHEN YOU NEED IT

Turns on Voice notes get a written transcript under them, for both people.

Without it **Voice notes still send and play — just no text.**

Where Any Whisper-compatible speech-to-text endpoint.

Paste as `STT_API_URL` `STT_API_KEY`

☐ Text messages

WHEN YOU NEED IT

Turns on Text alerts for the two things that matter: a new sign-in, and money received.

Without it **Nothing is texted (it is logged instead).**

Where twilio.com → a number + the account SID and auth token.

Paste as `TWILIO_ACCOUNT_SID` `TWILIO_AUTH_TOKEN` `TWILIO_FROM`

☐ GIF search

WHEN YOU NEED IT

Turns on Searching GIFs in chat and the composer.

Without it **The GIF tab says it is not set up. Stickers and emoji still work.**

Where Google Tenor API key (free) or a Giphy key.

Paste as `TENOR_API_KEY` `GIPHY_API_KEY`

☐ Shipping labels

WHEN YOU NEED IT

- Turns on** Sellers buy a real postage label in the app, and delivery is detected automatically.
- Without it** Sellers type the carrier and tracking number by hand. Everything else about shipping still works.
- Where** goshippo.com → API key. Add a track_updated webhook to /api/webhooks/shippo with a secret you choose.
- Paste as** SHIPPO_API_KEY SHIPPO_WEBHOOK_SECRET

☐ Live carrier prices

WHEN YOU NEED IT

- Turns on** Buyers pick from real shipping options at checkout.
- Without it** Checkout uses the seller's own flat fee. Perfectly workable.
- Where** SHIPPING_RATES as a small JSON list of options, or a carrier API.
- Paste as** SHIPPING_RATES SHIPPING_API_URL SHIPPING_API_KEY

☐ Sign in with Google

WHEN YOU NEED IT

- Turns on** One-tap Google sign-up and sign-in.
- Without it** The Google button is hidden. Email + password still works.
- Where** Google Cloud Console → OAuth client ID (Web).
- Paste as** GOOGLE_CLIENT_ID

☐ Sign in with Apple

WHEN YOU NEED IT

- Turns on** Apple sign-in — and Apple REQUIRES it in the App Store if you offer Google.
- Without it** The Apple button is hidden. Blocks App Store review later.
- Where** Apple Developer → Certificates, Identifiers & Profiles → Services ID.
- Paste as** APPLE_CLIENT_ID APPLE_APP_ID APPLE_DOMAIN_ASSOCIATION

☐ Live share prices

WHEN YOU NEED IT

- Turns on** Prices and charts on \$TICKER pages.
- Without it** Already on by default using a free source — a key only makes it sturdier.
- Where** finnhub.io if the free source ever gets rate-limited.
- Paste as** FINANCE_PROVIDER FINNHUB_API_KEY

☐ Encrypted vault key

WHEN YOU NEED IT

- Turns on** The admin vault encrypts what you store in it.
- Without it** The vault refuses to store secrets.
- Where** Any long random string in Railway → Variables.
- Paste as** DRIVE_KEY

☐ Force staff 2FA

WHEN YOU NEED IT

Turns on Nobody reaches the dashboard without two-factor. Recommended once you have staff.

Without it Staff can sign in with a password alone.

Where Set REQUIRE_ADMIN_2FA=true — but turn 2FA on for your own account FIRST.

Paste as REQUIRE_ADMIN_2FA

The 7 unfinished features

Of 505 features, **497 are built and verified**. These seven are what's left — and only three of them are waiting on me.

FEATURE	WHAT'S LEFT	WHAT IT NEEDS FROM YOU
Beam on the phone	Groups, photos, voice notes, reactions and calls inside the phone app.	Nothing — I can build this now.
Buying on the phone	Full checkout in the app: pick an address, pay from the wallet, buyer protection.	Nothing — I can build this now.
Selling on the phone	Manage your shop, orders and numbers from the phone.	Nothing — I can build this now.
App Store listing	Apple Pay, plus the public listing itself.	An approved Apple Developer account (\$99/year). You had TestFlight working before — tell me where that account stands. Apple also REQUIRES Sign in with Apple if you offer Google sign-in, so set that up too.
Android release	Nothing in the code — it already builds for Android from the same source.	A Google Play developer account (\$25, one time).
Home-screen widgets	Wallet balance, orders, unread and an AI shortcut on the phone home screen.	Genuinely blocked, and not by effort: a widget is separate Swift code that needs a different build setup than the one this app uses. It is a real piece of work, not a key.
Atwe Card (the real debit card)	Actually issuing cards tied to the wallet. The waiting list and the card design are already live.	A card-issuing partner (Stripe Issuing, Marqeta or similar) plus identity checks on members. This is months and a legal conversation — not code.

The three green rows I can start the moment you say go. The four red ones cannot be finished by writing code, however much time is spent on them — they need an account, a partner, or a different kind of build.

If you only do five things

- 1 **Stripe.** Turns the money real. Nothing else on this list matters as much.
- 2 **Email.** Until this is on, a member who forgets their password is stuck forever.
- 3 **The sign-in secret.** One random string. Thirty seconds. Without it everyone gets signed out whenever the server restarts.
- 4 **Atwe AI.** One key switches roughly 25 features from "not set up" to working.
- 5 **Tell me about the Apple account.** It's the only thing standing between the phone app and the App Store, and it takes Apple time — so start it early even though we build it later.

What happens next

1. You send me the **5 features** you want added. Rough wording is fine — I'll ask rather than guess.
2. I build them, tested against a real database and a real browser.
3. We go through the app **page by page, together** — you look, I fix, one step at a time.
4. When you're happy with every page, the web app is finished — and only then do we start the phone app.

You can work through this document at your own pace. Nothing here blocks the next stage — we can keep building while you open accounts.

Atwe — Setup Checklist · Build 1648 · Generated for the owner.

The live version of this list, showing what is actually connected on your server right now, is in your admin dashboard under **Setup**.
